

## Clean water is the basis of life

Good human and animal health starts with clean water. It is often taken for granted, but in practice, when we take a closer look at end user water quality, we see that this is far from always the case. And this while we all know that really clean water leads to good health and well-being and thus a higher return!

## The water filtering solution

PurAqua® water filters are intended to filter and remove contaminants from the water **and therefore prevent blockages** and unnecessary **equipment wear and tear** in the (drinking) water system. With filters available in various capacities and grades, the PurAqua® water filter offers a suitable solution for every system.

## Ecological and sustainable

PurAqua® water filters are equipped with a **centrifugal screw** which gives the incoming water a powerful, rotational, downward force. This pushes the heavier dirt particles to the bottom of the filter. The filter element thus retains **more capacity** for retaining finer contaminants. This, in combination with the **reusable filter elements**, makes the PurAqua® water filter the sustainable solution for water filtration.

## Simple and efficient to use

The PurAqua® water filter has a tap at the bottom, **which makes it easy to discharge coarser dirt particles** from **the** PurAqua® water filter. The manometers on the PurAqua® water filter display the current water pressure, making it easy to determine when the filter element needs to be replaced.
